DELIST_STRATEGY_BINANCE

from December 2024

When Binance announces upcoming delistings, there tends to be a significant price drop in the affected stocks. The price usually drops within a certain timeframe, allowing private investors to sell off and make a profit before the delisting officially happens. My goal was to develop a system to capitalize on this trend.

Data Collection

I gathered data from the Binance announcement board to track when stocks are being delisted and identify the impacted assets.

Stock Price Monitoring

I fetched the stock prices from Binance, calculating the price change from the previous close and comparing it with the real-time price. This helped to determine if the stock was likely to follow the typical plummet pattern.

Order Execution & Risk Management

If the conditions met the criteria, I would place an order and set up stop-loss and take-profit mechanisms to manage risk and lock in profits.
